REPORTS IN ZOHO CREATOR

Aim

To create and customize different types of reports (List, Grid, Summary, Kanban, Calendar and Chart) in the Crop Advisory System application built using Zoho Creator, and to understand how reports present, filter, group and analyze the data stored in forms.

Software / Tools Required

- A computer/laptop with internet connection
- Web browser (Google Chrome / Microsoft Edge)
- Zoho Creator account (creator.zoho.com)
- Crop Advisory System application (forms created in the earlier experiments)

Theory

In Zoho Creator, a report is a view of the records stored in one or more forms. While a form is used to enter data, a report is used to display, search, analyze and manage that data. Whenever a form is created, Creator automatically generates a default List report, and additional reports can be created with a different layout, filters, sort order and grouping.

Reports also allow users to perform actions directly on records, such as adding, editing, deleting, duplicating, exporting and printing. Each report type serves a different purpose: list and grid reports are used to browse records, summary and chart reports help in analysis, kanban reports track status-based workflows, and calendar reports show date-based records.

In the Crop Advisory System, reports help farmers and advisors view registered farmers, crop details, seasonal information and advisory requests in a clear and organized manner.

Report Types Explored

Report Type	Purpose	Observation (Crop Advisory System)
List Report	Displays records in a simple row-wise list with quick view and detail view	Used to view all farmer and crop records; default report generated for every form
Grid Report	Displays records in a spreadsheet-like layout with inline editing	Crop details such as crop name, soil type and season could be edited directly in the grid
Summary Report	Groups records and shows aggregate values (count, sum, average)	Records grouped by crop type / season with the number of entries in each group
Kanban Report	Shows records as cards arranged in columns based on a field value	Advisory requests arranged as cards under Pending, In Progress and Resolved
Calendar Report	Displays records on a calendar using a date field	Sowing dates / advisory request dates displayed on the calendar view

Report Type	Purpose	Observation (Crop Advisory System)
Chart Report	Presents data graphically as bar, pie, line or similar charts	Chart showing the number of advisory requests for each crop

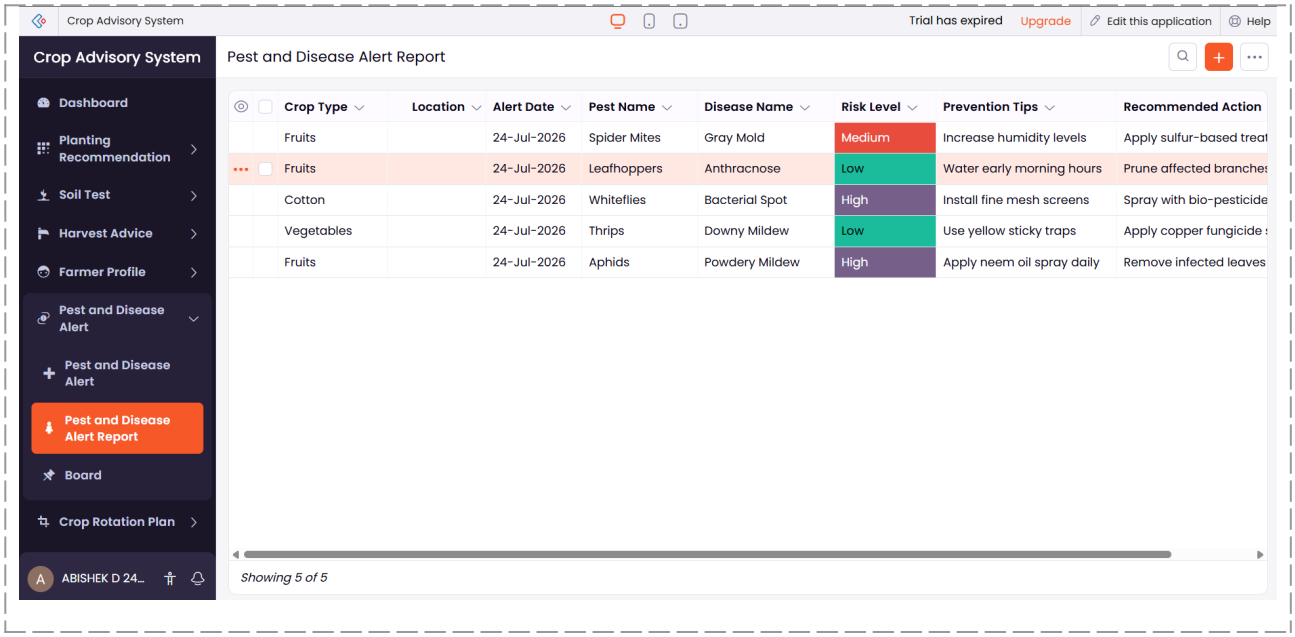

Report Features Explored

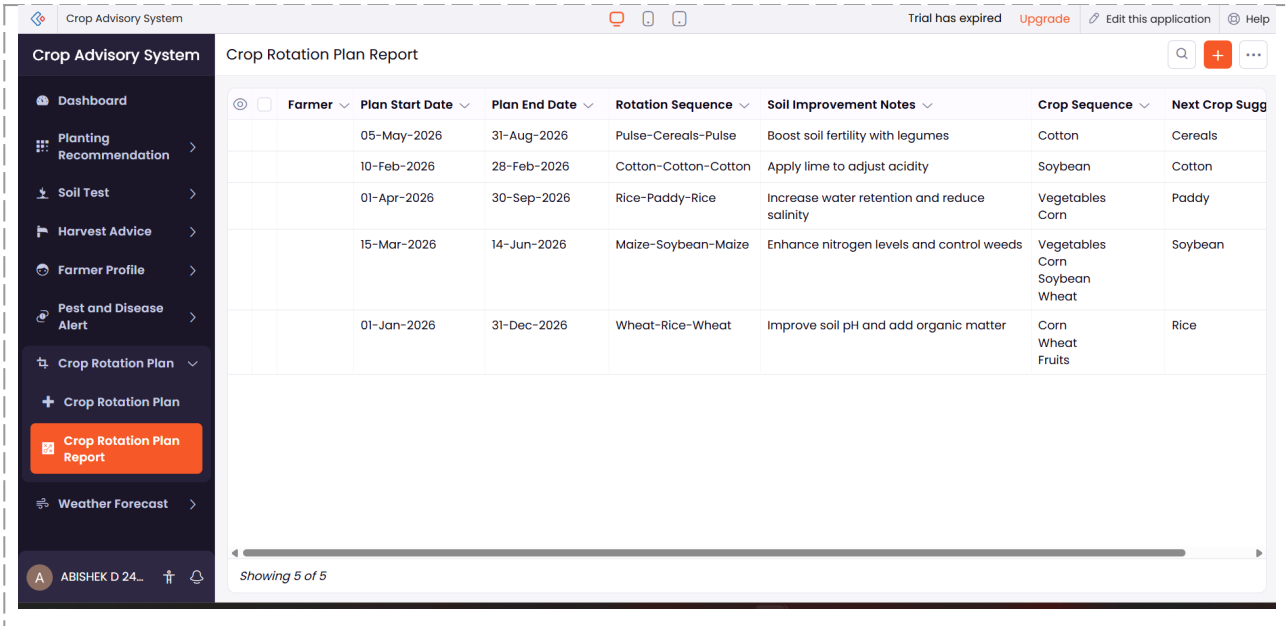

Feature	Observation
Filters	Records can be filtered by field values (for example, crop type or season) so that only relevant data is shown
Sort / Group By	Records can be sorted in ascending or descending order and grouped by a chosen field
Quick View / Detail View	Controls which fields appear in the list and which appear when a record is opened
Report Actions	Add, Edit, Delete, Duplicate, Export (CSV / Excel / PDF) and Print options available for records
Conditional Formatting	Rows or field values can be highlighted based on a condition (for example, urgent requests)

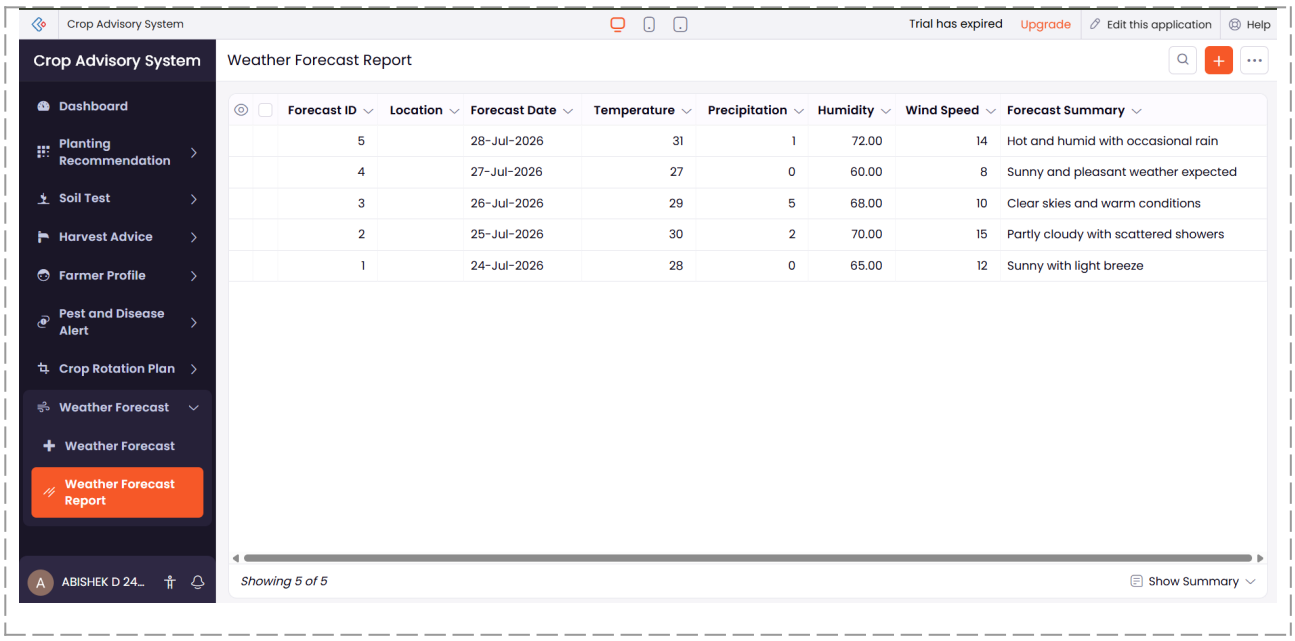

Procedure

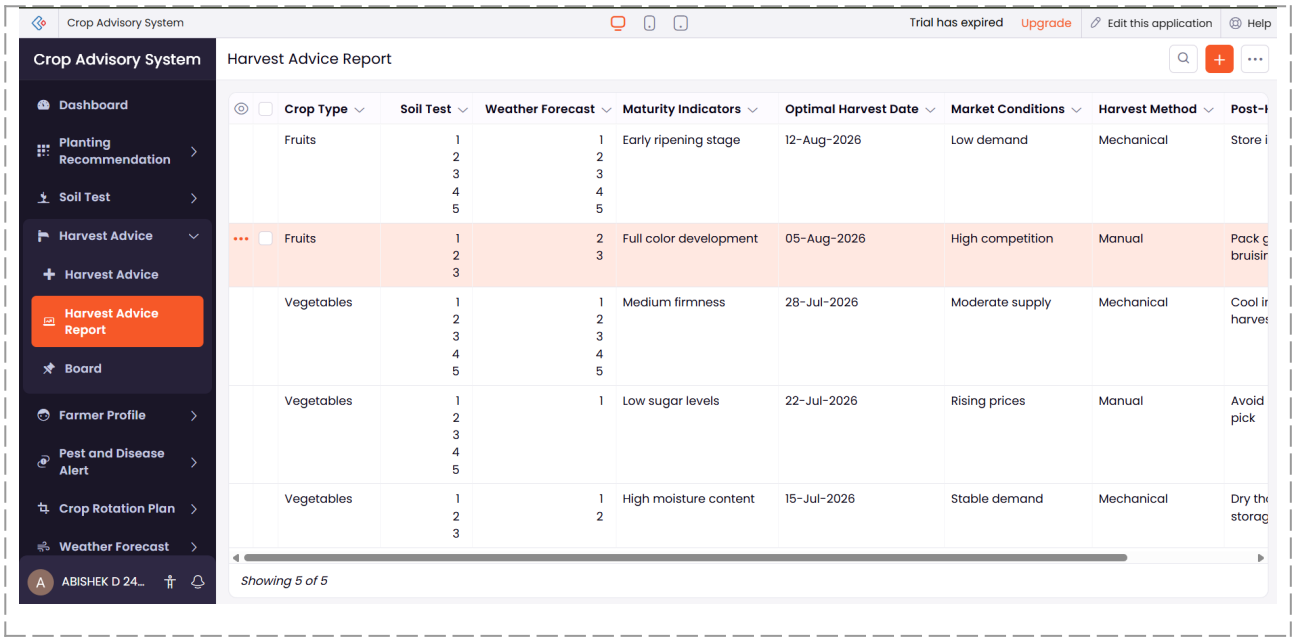

1. Log in to Zoho Creator (creator.zoho.com) and open the Crop Advisory System application from the dashboard.
2. Click 'Edit' on the application to open the development workspace.
3. In the left-side panel, observe the default reports that were created automatically along with each form.
4. Open the default List report of the crop form and observe how the records are displayed.
5. Open the report settings and apply filters, sorting and Group By on required fields.
6. Click 'Create New' → 'Report' and create a Grid report for the crop details.
7. Create a Summary report by grouping records based on Crop Type / Season and adding a count.
8. Create a Kanban report for advisory requests using the Status field as the grouping field.
9. Create a Calendar report using a date field such as sowing date or request date.
10. Create a Chart report to show the number of advisory requests per crop.
11. Access the application in the live mode and test the report actions such as Add, Edit, Delete, Export and Print.
12. Note down the observations for each report type.

Result

Various types of reports – List, Grid, Summary, Kanban, Calendar and Chart – were successfully created and customized for the Crop Advisory System application in Zoho Creator. The use of filters, sorting, grouping and report actions was understood, and it was observed that reports make the stored farmer, crop and advisory data easy to view, analyze and manage.
